

Topic Outline: Shaping Data

Revised: April 14, 2016

Materials

- Today's handout: this outline, conda/pip chapter
- Posted on *Topic outlines & links* page of website

Pandas 3: Data shaping

- Setup
 - Download IPython notebook and save Raw file in your `Data_Bootcamp` directory
Location: GitHub \Rightarrow Code \Rightarrow IPython \Rightarrow `bootcamp_pandas-clean.ipynb` \Rightarrow Raw
 - Open in Jupyter
 - In Cell, click on Run all
- Want operator
 - Keep in mind what we want, then figure out how to get there
 - Problems: rows and columns are flipped, or some variant of that
- Example: WEO data on debt and deficits
 - Wants: we want them in columns, but they run across rows; we need to refer to series by variable **and** country
- Setting and resetting the index
 - The `set_index` method: move column(s) into index
 - Multi-indexes
 - The `reset_index` method: the reverse
- Switching rows and columns
 - The transpose (**T**) method
 - Referring to variables with a multi-index
 - Swapping index levels
 - The `xs` method
- Shaping by stacking and unstacking
 - The `stack` method: move columns into the index
 - The `unstack` method: move index levels into columns
- Shaping by pivoting

- The `pivot` method: a shortcut
- **Review exercise**
 - Put red sticker on your laptop
 - Work through the review section of the notebook
 - Ask questions if you're stuck – or even if you're not
 - Replace red sticker with green when you're set
